# Number Theopry HW4 - Part 1

## M Bedir Tapkan

### November 13, 2017

## Solution 12

From Fermat's Little Theorem we know that $a^{p-1} \equiv 1(mod p)$. In our case it will be $3^{100} \equiv 1(mod 101)$ since 101 is a prime number.
We also know that:
$$3^{32,123,878,237,982,731,602} = 3^2 \times 3^{32,123,878,237,982,731,600} = 3^2 \times (3^{100})^{321,238,782,379,827,316}$$
$$(3^{100})^{321,238,782,379,827,316} \equiv 3^2 \times 1^{321,238,782,379,827,316}(mod 101) \equiv 9(mod 101)$$

## Solution 13

**a:** $1234 = 2^{10} + 2^7 + 2^6 + 2^4 + 2^1$
